Introduction to Play Play is a UI toolkit for building performant, high-quality web apps using technologies — HTML, CSS, and JavaScript — with integrations for popular frameworks like Angular, React. Get started building by installing Play or following our First App Tutorial to learn the main concepts.

- Play focuses on the frontend UX and UI interaction of an app — UI controls, interactions, gestures, animations. It's easy to learn, and integrates with other libraries or frameworks, such as Angular, React. If you'd like to learn more about Play before diving in, we created a video to walk you through the basics.
- A focus on performance
- Play is built to perform and behave great on the latest browsers with best practices.
- Clean, simple, and functional design
- Play is designed to work and display beautifully on all current browsers. With ready-made components, typography, and a gorgeous (yet extensible) base theme that adapts to each platform, you'll be building in style.
